

## VARIMETER

### Undervoltage Relay, 3-phase

IK 9171, IL 9171, SK 9171, SL 9171

- According to IEC/EN 60255-1
- Monitoring of undervoltage in 3-phase system
- Also for single phase
- Without auxiliary supply
- Optionally for 3p3w systems
- LED indicator for state of output relay
- Independent of phase sequence
- 1 or 2 changeover contacts
- Optionally fixed or settable response value
- As option with phase sequence detection
- Optionally with or without N
- Optionally with off-delay  $t_1$
- Optionally with on delay  $t_2$
- Devices available in 2 enclosure versions:
  - I-model: depth 59 mm, with terminals at the bottom for installation systems and industrial distribution systems according to DIN 43 880
  - S-model: depth 98 mm, with terminals at the top for cabinets with mounting plate and cable duct
- Width:
  - IK 9171, SK 9171: 17.5 mm
  - IL 9171, SL 9171: 35 mm

#### Function Diagram

#### Application

Monitoring of voltage systems on undervoltage. Automatic switching to emergency supply or of emergency light in the case of phase loss according to DIN VDE 0100-710 or DIN VDE 0108.

Variants with  $t_2$  is used in unstable voltage systems, where after phase failure detection the consumers should be energized one after the other. This is done by setting the operate delay e.g. 0.1 ... 20 s of the different relays to different values.

This variant is also used where a consumer after only short phase failure should not be started immediately (e.g. compressors).

#### Function

The arithmetic mean value of each phase is measured against N. The variants without N measure L1 and L3 against L2 (IK/SK 9171) and L1 and L2 against L3 (IL/SL 9171).

#### Indicators

Yellow LED: output contact active (11-14 closed)

#### Notes

To measure single-phase voltage terminals L1, L2, L3 have to be linked together.

The time delay  $t_1$  is only active if the voltage L1-N (IK/SK 9171) or L3-N (IL/SL 9171) is at least  $0,5 U_N$ .

Please be aware, that devices of this variant show "good" state after applying power supply even when there is a fault e.g. wrong phase sequence or undervoltage. Only after elapse of the time delay  $t_1$  the unit changes into "failure" state.

IL 9171.12/801: as Standard Type /200 but

output relay with goldplated contacts.

This module is also suitable for switching small

loads. The contacts also

permit the maximum switching current (4 A).

However, since the gold plating will be burnt off

at this current level, the device is no longer

suitable for switching small loads after this.
