Light barrier amplifier

ISM-1100 / ISM-1100S

Features

- · Light barrier with modulated infrared light
- High degree of immunity to ambient light, disturbing impulse and influence from other light barriers
- Range up to 55 m
- Manual gain setting with potentiometer
- Switching output 60 V / 100 mA, floating distance
- Alarm output
- Test input for external test equipment
- Transmitter and receiver connections are short circuit proof
- Mounting for DIN rail EN 60715

Short Description

The light barrier amplifier ISM series were specially designed for areas with a high range or extreme dirt in which other light barriers reach their limits.

The system includes an amplifier, transmitter IT..., and receiver IR..., and has very high power. Distances up to 55 m are possible. The modulation of the infrared light will additionally give the system a high degree of immunity to ambient light, disturbing impulse and influence from other light barriers.

The amplifier is equipped with a gain potentiometer, with which the transmit power adjusts to the changing environments of the application.

A green LED shows the optimal set point of the transmit power and also shows when the power exceeds this set point during operation.

A floating distance and short circuit proof switching output reports the light beam status, free or interrupted, to the following evaluation unit, e.g. a PLC. A yellow LED shows this.

Included as extra equipment is the integrated test input with which it is possible to examine the light barrier system's functionality. When the test input is activated, the transmitter will be switched off and the status of the switching output should change.

Infrared transmitters and receivers in different, compact and robust designs are described in the sensor heads datasheet.

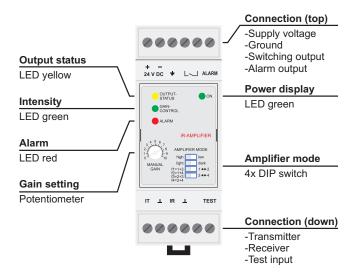

Safety Instructions

The infrared light barriers ISM-... are not safety systems and should not be used as such systems.

The devices are not to be used for applications, where personal safety is dependent on their function.
